

Recommended vaccination schedule for puppies:

DA2PP #1 in series @ 8 weeks of age

DA2PP #2 and Lepto #1 in series @ 12 weeks of age

DA2PP #3 and Lepto #2 in series @ 16 weeks of age

Adult dogs should get DA2PP one year after puppy series and then every 3 years **OR** annually as recommended by your doctor.

*** Ask about adding Leptospirosis to your puppy's vaccination schedule!**

We recommend fecal exams at every visit, monthly flea/tick prevention, and microchipping.

Rabies can be given any time after 12 weeks of age. First vaccine is valid for one year, no matter the patients age. Then, repeated every 3 years after that. **It is Washington State law that all domesticated animals are vaccinated against rabies. (cats, dogs & ferrets)**
